

ADScan is the only PDF/UA compliant website crawling validation tool for document accessibility. ADScan is an automated tool that scans your website and reports on the accessibility of all PDF files found, while identifying all other document types found. The scan becomes the foundation for building a successful document accessibility strategy.

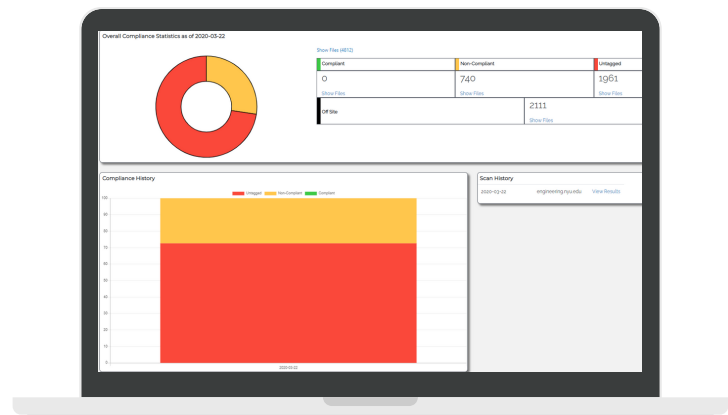

With a dashboard approach for both decision makers and remediators, ADScan provides a single page view of all document accessibility criteria. This allows for planning of a document accessibility strategy (how many documents, how many pages, how many tagged and how many are compliant). Once ADScan has been utilized, there is sortable data to implement a sustainable approach to document accessibility.

## UA Index

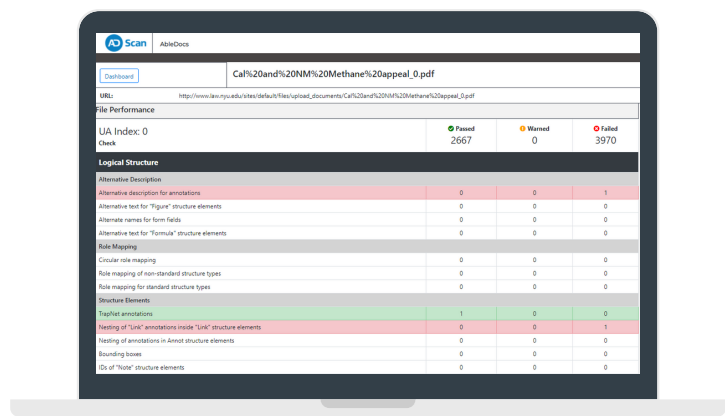

AbleDocs has developed a proprietary analysis approach to help organizations understand the impact of the errors found in testing the compliance of files against PDF/UA. Understanding the impact of the error value will help organizations recognize the true impact of the errors of their inaccessible files.

This allows internal teams to determine what tactic to pursue in making their document accessible; internal remediation by the author, internal remediation by a center of excellence, outsourcing to AbleDocs or utilizing other services from AbleDocs to build a sustainable document accessibility strategy.
